Work survives the conversation

As-built mechanisms / 3.0.0rc2 / 13 November 2026 / local request-driven processes

Client A

Native app + selected model
Own login, tools and approvals

Client B

Independent session or model
Own login, tools and approvals

CLI entrypoints

harness task publishes board checkpoints
plan operates the work graph

LOCAL HARNESS / SAME HOME + CANONICAL PROJECT

Per-client MCP server

One process per connection; initialization and tool-response context
Supported lifecycle hooks provide another client-specific entrypoint

plan tool

Work graph

Dependencies, claims and gate evidence
Exit 0 settles; failure returns pending

read / checkpoint

retrieve / record

screen command

failed gate returns pending

Shared task board

SQLite tasks, versions and event cursors
CAS rejects stale writes; retries use IDs
Advisory summaries point to checkpoints

Source-backed memory

Retained revisions and scoped claims
Lexical / FTS retrieval and source checks
Corrections invalidate derived evidence

Execution controls

Command guard screens gate commands
Native approvals and OS rights still apply
Sandbox protection depends on setup

admitted scope only

allowed execution

Evaluation and scoped adoption

Frozen cases + independent outcomes + measured preparation/trial cost
Generated procedures remain held after token regression

outcomes

Tools, tests and artifacts

Real subprocess results become evidence
A passing gate has its declared scope

FOUR DESIGN DIRECTIONS

Framework
Coordination and recovery

Methodology
Gates, review and evaluation

Philosophy
Assumptions and counterexamples

Knowledge
Sources and corrections

Solid arrows show request/data paths. Dashed arrows show conditional feedback. Cross-device synchronization remains unqualified.
